                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          One N-glycosylation site, i.e. NSS (117-119) is substituted with NSM and the N-glycosylation is removed.
Plasmid encoding the modified tPA is 99-6300 and its transformant is E.coli RR1. Zem 99-6300 (FERM P-9127).
This modified tPA, used to treat thrombosis, is of high quality and has a longer half life period in blood.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  It is modified in the patent by replacing one or more codons specifying
a positively charged amino acid. The resulting analogues are inserted
through the charged amino acid. The resulting analogues are inserted
through the charged in useful for the treatment of diseases or disorders
associated with the formation of thrombi in blood vessels e.g.
infarctions, thrombosis and embolism. The analogue, in the 1-chain form,
chibits the properties of a proenzyme; however on plasmin-catalysed
cleavage of the one-chain form, the activity of the 2-chain form is fully
tetained. Compared to native t-PA, it has a higher fibrin selectivity,
this results in a fibrinolytic agent with a higher fibrin selectivity,
as the fibrinogenolytic activity induced by the analogue is reduced
relative to that induced by native 1-chain t-PA.
(Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                  tPA with N-terminal peptide of plasminogen linked is more stable in vivo than the native form. It is useful as a thrombolytic agent in the treatment of vascular diseases eg myocardial infarction,
                                          New tissue plasminogen activator - having N-terminal peptide of plasminogen linked to tissue plasminogen activator for increased stability in vivo.
                                                                                                                                                                                                                                                            DB 11; Length 2100;

                                                                                                                                                                                                                                                                                        Gaps
                                             A cDNA clone of human tissue plasminogen activator (tPA) was amplified by PCR using the primers given in AA087366-69. The amplified tPA DNA (AAQ87370) was ligated into vector KS+ to obtain plasmid TPA-KS+. The construct was used in combinatorial methods involving RNA splicing-mediated shuffling of tPA domains implasmid pinvl (AAQ87347) to generate novel tPAs having limproved thrombolytic properties.

                                                                                                                                                                                                                                                                                                   ద
The present sequence represents the human tissue plasminogen activator gene. It was used to construct plamsid TPA-KS+, which is used in the countries of the invention. The specification describes a purified reverse oblicing intron which comprises a segment comprising a reverse-splicing intron which comprises a segment comprising a raturally present in the intron and a second segment comprising a naturally present in the intron and a second segment comprising a retargetor, and a nucleophilic group for transesterifying a phosphodiester bond of an RNA. Together the two segments form an applicable of an expense splicing reaction the first segment into substrate RNA by a reverse splicing reaction. The reverse-splicing introns are used, by specific cleavage and ligation of discontinuous nucleic acid, to generate new genes and gene products, e.g. ribozymes (for use in gene therapy or as reagents in DNA manipulation, e.g. replacements for restriction enzymes) or immunologically active or signal-transducing proteins such as antibody

The cDNA was used to construct a gene library which was screened with a partial t-PA cDNA clone. Plasmid pKG12 was isolated and shown to comprise the whole coding region for human t-PA as well as 102bp 5'flanking, 760 bp 3' flanking DNA and a poly A tail. See also AAN91608. Patent No. 5840533

GENERAL INFORMATION:
APPLICANT: SAITO, YOSHIMASA
APPLICANT: SASAKI, HITOSHI
APPLICANT: MASAKA
APPLICANT: HAYASHI, MASAKO
APPLICANT: KOBAYASHI, MASAKO
APPLICANT: TISSUB PLASMINOGEN ACTIVATOR
ITILE OF INVENTION: TISSUB PLASMINOGEN ACTIVATOR
NUMBER OF SEQUENCES: 67
CORRESPONDENCE ADDRESS:
ADDRESSEE: DELON, SPIVAK, MCCLELLAND, MAIER & NEUSTADT,
ADDRESSEE: P.

                                                                                                                                                                                                                                                                                                                                                                               KESUL.

US-08-883-795A-39

Sequence 39, Application US/08883795A

Patent No. 5985607

GENERAL INFORMATION:

APPLICANT: Delcuve, Genevieve

APPLICANT: Awang, Gregor

TITLE OF INVENTION: Recombinant DNA Molecules and Expression

TITLE OF INVENTION: Vectors for Tissue Plasminogen Activator

NUMBER OF SEQUENCES: 39

CORRESPONDENCE ADDRESS:

ADDRESSEE: BERESKIN & PARR

STREET: 40 King Street West
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
